

FEATURES

Ultrawideband frequency range: 9 kHz to 30 GHz

Nonreflective 50 Ω design

Low insertion loss: 2.0 dB to 30 GHz

High isolation: 60 dB to 30 GHz

High input linearity

1 dB power compression (P1dB): 28 dBm typical

Third-order intercept (IP3): 52 dBm typical

High power handling

24 dBm through path

24 dBm terminated path

ESD sensitivity: Class 1, 1 kV human body model (HBM)

20-terminal, 3 mm \times 3 mm land grid array package

No low frequency spurious

Radio frequency (RF) settling time (to 0.1 dB of final RF output): 6.2 μ s

APPLICATIONS

Test instrumentation

Microwave radios and very small aperture terminals (VSATs)

Military radios, radars, electronic counter measures (ECMs)

Broadband telecommunications systems

GENERAL DESCRIPTION

The **ADRF5021** is a general-purpose single-pole, double-throw (SPDT) switch manufactured using a silicon process. It comes in a 3 mm \times 3 mm, 20-terminal land grid array (LGA) package and provides high isolation and low insertion loss from 9 kHz to 30 GHz.

FUNCTIONAL BLOCK DIAGRAM

Figure 1.

This broadband switch requires dual supply voltages, +3.3 V and -2.5 V, and provides CMOS/LVTTL logic-compatible control.

REVISION HISTORY

2/2017—Rev. 0 to Rev. A

Changed $V_{EN} = 3.3\text{ V}$ to 5 V to $V_{EN} = 0\text{ V}$ or 3.3 V to 5 V 3

7/2016—Revision 0: Initial Version

SPECIFICATIONS

$V_{DD} = 3.3\text{ V to }5\text{ V}$, $V_{SS} = -2.5\text{ V}$, $V_{CTRL} = 0\text{ V or }3.3\text{ V to }5\text{ V}$, $V_{EN} = 0\text{ V or }3.3\text{ V to }5\text{ V}$, $T_{CASE} = 25^\circ\text{C}$, $50\ \Omega$ system, unless otherwise noted.

Table 1.

Parameter	Symbol	Test Conditions/Comments	Min	Typ	Max	Unit
FREQUENCY RANGE			0.009		30,000	MHz
INSERTION LOSS						
Between RFC and RF1/RF2		9 kHz to 10 GHz		1.1		dB
		10 GHz to 20 GHz		1.4		dB
		20 GHz to 30 GHz		2.0		dB
ISOLATION						
Between RFC and RF1/RF2		9 kHz to 10 GHz		65		dB
		10 GHz to 20 GHz		60		dB
		20 GHz to 30 GHz		60		dB
Between RF1 and RF2		9 kHz to 10 GHz		70		dB
		10 GHz to 20 GHz		65		dB
		20 GHz to 30 GHz		60		dB
RETURN LOSS						
RFC and RF1/RF2 (On)		9 kHz to 10 GHz		23		dB
		10 GHz to 20 GHz		17		dB
		20 GHz to- 30 GHz		13		dB
RF1/RF2 (Off)		9 kHz to 10 GHz		30		dB
		10 GHz to 20 GHz		18		dB
		20 GHz to 30 GHz		8		dB
SWITCHING						
Rise and Fall Time	t_{RISE}, t_{FALL}	10% to 90% of RF output		1.0		μs
On and Off Time	t_{ON}, t_{OFF}	50% V_{CTL} to 90% of RF output		1.1		μs
RF Settling Time						
0.1 dB		50% V_{CTL} to 0.1 dB of final RF output		6.2		μs
0.05 dB		50% V_{CTL} to 0.05 dB of final RF output		10		μs
INPUT LINEARITY ¹		1 MHz to 30 GHz				
Power Compression						
0.1 dB	P0.1dB			27		dBm
1 dB	P1dB			28		dBm
Third-Order Intercept	IP3	Two-tone input power = 14 dBm each tone, $\Delta f = 1\text{ MHz}$		52		dBm
SUPPLY CURRENT		VDD, VSS pins				
Positive	I_{DD}	$V_{DD} = 3.3\text{ V}$		80	300	μA
		$V_{DD} = 5\text{ V}$		100	600	μA
Negative	I_{SS}	$V_{SS} = -2.5\text{ V}$		<1	10	μA
DIGITAL CONTROL INPUTS		CTRL, EN pins				
Voltage						
Low	V_{INL}	$V_{DD} = 3.3\text{ V}$	0		0.8	V
		$V_{DD} = 5\text{ V}$			0.9	V
High	V_{INH}	$V_{DD} = 3.3\text{ V}$	1.2		3.3	V
		$V_{DD} = 5\text{ V}$	1.7		5.0	V
Current						
Low and High	I_{INL}, I_{INH}			<1		μA

Parameter	Symbol	Test Conditions/Comments	Min	Typ	Max	Unit
RECOMMENDED OPERATING CONDITIONS						
Supply Voltage						
Positive	V_{DD}		3.0		5.4	V
Negative	V_{SS}		-2.75		-2.25	V
Digital Control Voltage	V_{CTL}		0		V_{DD}	V
RF Input Power ²	P_{IN}	$f = 1 \text{ MHz to } 30 \text{ GHz}, T_{CASE} = 85^{\circ}\text{C}$				
Through Path		RF signal is applied to RFC or through connected RF1/RF2			24	dBm
Terminated Path		RF signal is applied to terminated RF1/RF2			24	dBm
Hot Switching		RF signal is present at RFC while switching between RF1 and RF2			18	dBm
Case Temperature	T_{CASE}		-40		+85	$^{\circ}\text{C}$

¹ For input linearity performance at frequencies less than 1 MHz, see Figure 15 to Figure 17.

² For power derating at frequencies less than 1 MHz, see Figure 2 to Figure 4.

ABSOLUTE MAXIMUM RATINGS

For recommended operating conditions, see Table 1.

Table 2.

Parameter	Rating
Supply Voltage	
Positive	-0.3 V to +5.5 V
Negative	-2.75 V to +0.3 V
Digital Control Input Voltage	-0.3 V to $V_{DD} + 0.3 V$
RF Input Power ¹ (f = 1 MHz to 30 GHz, $T_{CASE} = 85^{\circ}C$)	
Through Path	27 dBm
Terminated Path	25 dBm
Hot Switching	21 dBm
Temperature	
Junction (T_J)	135°C
Storage	-65°C to +150°C
Reflow (MSL3 Rating)	260°C
Junction to Case Thermal Resistance, θ_{JC}	
Through Path	420°C/W
Terminated Path	160°C/W
ESD Sensitivity	
HBM	1 kV (Class 1)

¹ For power derating at frequencies less than 1 MHz, see Figure 2 to Figure 4.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

Only one absolute maximum rating can be applied at any one time.

POWER DERATING CURVES

ESD CAUTION

ESD (electrostatic discharge) sensitive device. Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

NOTES
 1. THE EXPOSED PAD MUST BE CONNECTED TO THE RF/DC GROUND OF THE PRINTED CIRCUIT BOARD (PCB).

14580-005

Figure 5. Pin Configuration (Top View)

Table 3. Pin Function Descriptions

Pin No.	Mnemonic	Description
1, 2, 4 to 7, 9, 10, 13, 16, 17, 19, 20	GND	Ground. These pins must be connected to the RF/dc ground of the printed circuit board (PCB).
3	RFC	RF Common Port. This pin is dc-coupled to 0 V and ac matched to 50 Ω. No dc blocking capacitor is necessary when the RF line potential is equal to 0 V dc. See Figure 6 for the interface schematic.
8	RF1	RF1 Port. This pin is dc-coupled to 0 V and ac matched to 50 Ω. No dc blocking capacitor is necessary when the RF line potential is equal to 0 V dc. See Figure 6 for the interface schematic.
11	VDD	Positive Supply Voltage.
12	CTRL	Control Input. See Figure 7 for the interface schematic.
14	EN	Enable Input. See Figure 7 for the interface schematic.
15	VSS	Negative Supply Voltage.
18	RF2	RF2 Port. This pin is dc-coupled to 0 V and ac matched to 50 Ω. No dc blocking capacitor is necessary when the RF line potential is equal to 0 V dc. See Figure 6 for the interface schematic.
	EPAD	Exposed Pad. The exposed pad must be connected to the RF/dc ground of the PCB.

TYPICAL PERFORMANCE CHARACTERICS

INSERTION LOSS, RETURN LOSS, AND ISOLATION

Insertion loss and return loss measured on the probe matrix board using the ground, signal, ground (GSG) probes close to the RF pins; isolation measured on an evaluation board because signal coupling between the probes limits the isolation performance of the ADRF5021 on the probe matrix board (see the Applications Information section for details of evaluation and probe matrix boards).

THEORY OF OPERATION

The [ADRF5021](#) requires a positive supply voltage applied to the VDD pin and a negative supply voltage applied to the VSS pin. Bypassing capacitors are recommended on the supply lines to minimize RF coupling.

The [ADRF5021](#) is internally matched to 50 Ω at the RF common port (RFC) and the RF throw ports (RF1 and RF2); therefore, no external matching components are required. All of the RF ports are dc-coupled to 0 V, and no dc blocking is required at the RF ports when the RF line potential is equal to 0 V. The design is bidirectional; the RF input signal can be applied to the RFC port while the RF throw port (RF1 or RF2) is output or vice versa.

The [ADRF5021](#) incorporates a driver to perform logic functions internally and to provide the user with the advantage of a simplified control interface. The driver features two digital control input pins, CTRL and EN.

When the EN pin is logic low, the RF1 to RFC path is in an insertion loss state, and the RF2 to RFC path is in an isolation state, or vice versa, depending on the logic level applied to the CTRL pin. The insertion loss path (for example, RF1 to RFC)

conducts the RF signal equally well in both directions between its throw port (for example, RF1) and common port (RFC). The isolation path (for example, RF2 to RFC) provides high loss between the insertion loss path and its throw port (for example, RF2) terminated to an internal 50 Ω resistor.

When the EN pin is logic high, both the RF1 to RFC path and the RF2 to RFC path are in an isolation state regardless of the logic state of CTRL. RF1 and RF2 ports are terminated to internal 50 Ω resistors, and RFC becomes open reflective.

The ideal power-up sequence is as follows:

1. Power up GND.
2. Power up VDD and VSS. The relative order is not important.
3. Power up the digital control inputs. The relative order of the logic control inputs is not important. However, powering the digital control inputs before the VDD supply can inadvertently forward bias and damage the internal ESD protection structures.
4. Apply an RF input signal.

Table 4. Control Voltage Truth Table

Digital Control Input		RF Paths	
EN	CTRL	RF1 to RFC	RF2 to RFC
Low	Low	Isolation (off)	Insertion loss (on)
Low	High	Insertion loss (on)	Isolation (off)
High	Low	Isolation (off)	Isolation (off)
High	High	Isolation (off)	Isolation (off)

APPLICATIONS INFORMATION

EVALUATION BOARD

Figure 18 and Figure 19 show the top and cross sectional views of the evaluation board, which uses 4-layer construction with a copper thickness of 0.5 oz (0.7 mil) and dielectric materials between each copper layer.

Figure 18. Evaluation Board Layout (Top View)

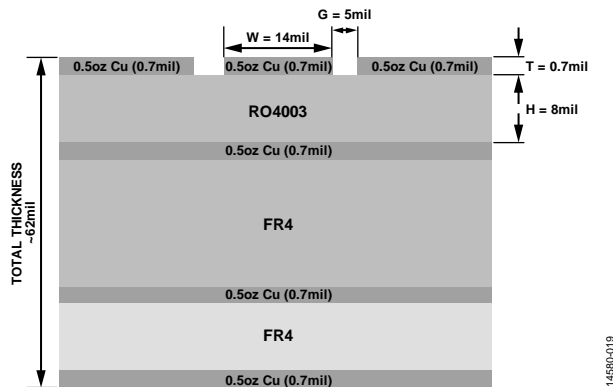

Figure 19. Evaluation Board (Cross Sectional View)

All RF and dc traces are routed on the top copper layer whereas the inner and bottom layers are grounded planes that provide a solid ground for the RF transmission lines. Top dielectric material is 8 mil Rogers RO4003, offering good high frequency performance. The middle and bottom dielectric materials are FR-4 type materials to achieve an overall board thickness of 62 mil.

The RF transmission lines were designed using a coplanar waveguide (CPWG) model with a width of 14 mil and ground spacing of 5 mil to have a characteristic impedance of 50 Ω. For good RF and thermal grounding, as many plated through vias as possible are arranged around transmission lines and under the exposed pad of the package.

Figure 20 shows the actual ADRF5021 evaluation board with component placement. Two power supply ports are connected to the VDD and VSS test points, TP5 and TP2, and the ground reference is connected to the GND test point, TP1. On each supply trace, a 100 pF bypass capacitor is used, and unpopulated components positions are available for applying extra bypass capacitors.

Figure 20. Populated Evaluation Board

Two control ports are connected to the EN and CTRL test points, TP3 and TP4. On each control trace, a resistor position is available to improve the isolation between the RF and control signals. The RF ports are connected to the RFC, RF1, and RF2 connectors (J1, J2, and J3) that are end launch 2.4 mm RF connectors. A through transmission line that connects unpopulated RF connectors (J7 and J8) is also available to measure the loss of the PCB. Figure 21 and Table 5 are the evaluation board schematic and bill of materials, respectively.

The evaluation board shown in Figure 20 is available from Analog Devices, Inc., upon request.

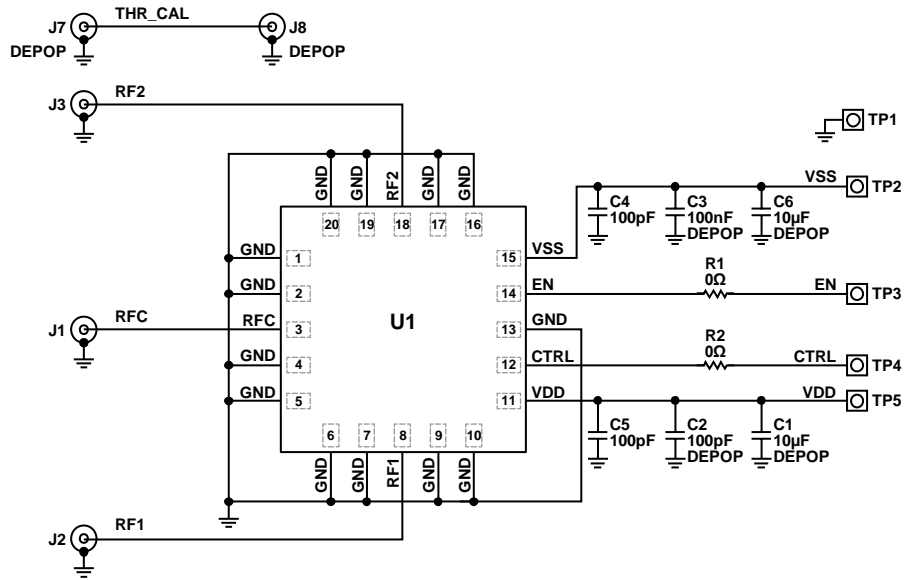

Figure 21. Evaluation Board Schematic

Component	Description
J1, J2, J3	End launch connectors, 2.4 mm
J7, J8	Unpopulated end launch connectors, 2.4 mm
TP1 to TP5	Through hole mount test points
C4, C5	100 pF capacitors, 0402 package
C2, C3	Unpopulated capacitors, 0402 package
C1, C6	Unpopulated capacitors, 0603 package
R1, R2	0 Ω resistors, 0402 package
U1	ADRF5021 SPDT switch
PCB	600-01583-00-1 evaluation PCB

PROBE MATRIX BOARD

Figure 22 and Figure 23 show the top and cross sectional views of the probe matrix board that measures the s-parameters of the ADRF5021 at close proximity to RF pins using the GSG probes. The actual board duplicates the same layout in matrix form to assemble multiple devices and uses RF traces for through, reflect, and line (TRL) calibration.
